## Estimated Water Volume

Water Storage Name	Beginning 2023	End 2023	Capacity	Comments
M1	1.8ML	1.8ML	1.8ML	M series Dams act together to treat mine water pumped from Underground and stormwater, discharged via LDP1
M2	0.5ML	0.5ML	0.5ML	
M3	9.0ML	9.0ML	9.0ML	
M4	8.0ML	8.0ML	8.0ML	
M5	1.5ML	0.5ML	3.0ML	
M6	4ML	2ML	4.5ML	
S1	0ML	0ML	14.5ML	The coking coal stockpile acts as a retention basin during major storms. Discharges to S2 Dam. Stockpile Dams are kept full and are used to supply water used for Dust suppression. Discharges to S4 Dam.
S2/S3	8.3ML	8.0ML	8.3ML	
S4	1.8ML	7ML	36.9ML	The Dam is designed to act as a retention basin with a controlled outlet. Discharges via overflow Point 4.
S5	0.3ML	0.3ML	0.5ML	Silt Trap only. Discharges to S6
S6	1ML	1ML	1.5ML	This Dam is designed to act as a retention basin with a controlled outlet.
S7	2ML	10ML	41.5ML	This is the main catchment for runoff from the REA. The dam is a retention basin during peak rainfall events. All water is pumped into Dam S4 via S9.
S7A	10ML	10ML	12.0ML	These Dams are designed to act as retention basins with a controlled outlet to S7 Dam.
S7B	0.8ML	0.2ML	1.0ML	
S8	2ML	1.5ML	4.5ML	Dam retains overflow from S7b. Pumps to Dam S9. Discharges via LOP5.
S9	0.2ML	0.15ML	0.4ML	Silt trap only for sealed Haul road. Wet well pumps to Dam S4. Discharges via LOP3.
STP1	590KL	590KL	590KL	Treated effluent overflows to M1 Dam.
STP2	590KL	590KL	590KL	
Tank No.1	250KL	250KL	250KL	Underground potable water supply
Tank No.2	250KL	250KL	250KL	Underground potable water supply

# 1. Introduction

## PURPOSE OF THIS REPORT

ELA conducts annual monitoring of site in accordance with the Tahmoor Coal's *Rehabilitation Management Plan - TAH-HSEC-402* and *Rehabilitation Strategy TAH-HSEC-401* and Rehabilitation Monitoring procedure. This report documents the 2023 monitoring results. This is completed by:

- an annual walkover inspection of all areas within the Refuse Emplacement Area (REA) where rehabilitation activities have been completed including newly established revegetation
- monitoring of permanent monitoring sites within each mine closure Domain. Within the REA (closure Domain 3) permanent plots have been established in each development stage to assess revegetation progress.

These guidelines state:

*“The objective of this monitoring is to evaluate progress of rehabilitation towards fulfilling long term land use objectives, such as the development towards a self-sustaining ecosystem.”*

## BACKGROUND

Rehabilitation of vegetation within the REA has been carried out since 1993, as each stage of the refuse emplacement was constructed. The permanent monitoring sites program began in 2010 with the establishment of two permanent plots within each existing section of the REA and two reference site plots within relatively undisturbed native vegetation nearby of the same Plant Community Type. As each stage of the REA was completed permanent plots have been established following revegetation. In addition, further plots were established in areas greater than four hectares to address the recommendations for native vegetation monitoring provided in the Rehabilitation Strategy. In future, in accordance with monitoring guidelines, additional permanent plots will be installed as each area of revegetation within the REA reaches an age of 5 years from planting.

## MONITORING METHODOLOGY

Monitoring of permanent sites in the rehabilitation areas provides information regarding changes in both vegetation growth, senescence, colonisation and species diversity. In addition, indication of the success of the rehabilitation is gained through comparison of both vegetation structure and species composition with the reference sites monitored in nearby bushland. Methods for measuring these values include:

- detailed species counts and cover within 2 m x 2 m nested quadrats
- species diversity within 2 m x 2 m nested quadrants
- canopy cover
- growth rates of trees via Diameter at Breast Height (DBH) measurement
- reproductive potential, progress within a 20 m x 10 m plot and
- Photographic monitoring of plots is also implemented.

The walkover inspection records details across each stage and includes information on the following factors:

- evidence of soil profile development and visual assessment of surface materials

- evidence of erosion and stability, and function of erosion and sediment control structures
- growth rates and evidence of plant mortality or dieback
- species diversity including identification of target species
- presence of over-storey, midstorey and understorey species
- evidence of reproductive potential
- evidence of biological nutrient cycling
- occurrence of potholing or slumping and evidence of spontaneous combustion
- evidence of contamination or other limitations to vegetative establishment.

Native grass species have been trialled via direct seeding, in areas where the existing vegetation within established revegetation areas was sparse. These grass planting trials were monitored to review the survival and growth of planted species.

More detailed presentation of the monitoring results is included in the appendices:

- **Appendix A - Monitoring 2023 – Mine Closure Domains 1 – 5 Permanent Sites and**
- **Appendix B - Monitoring 2023 - Annual Walkover – Refuse Emplacement Area and No. 2 Shaft Power Corridor.**

These appendices include collated details of the recorded monitoring results, the collected field data sheets, and monitoring photographs.

## 2. Results

### 2.1 Previous monitoring results

Revegetation across the REA was highly variable with some sections approximately 21 years old and others newly established with seeding carried out 36 months prior to monitoring. The native species included in the revegetation mix also varies, in both diversity and structural representation, between those areas revegetated prior to 2006 and those revegetated more recently.

Characteristics of sections revegetated prior to 2006 include:

- Canopy species including *Eucalyptus* species, *Angophora* species and *Allocasuarina littoralis* (Black She-oak) providing canopy cover ranging from good to limited, heights up to 10 m and exhibiting good growth. Second generation *A. littoralis* were common near mature plants, with other canopy species second generation plants beginning to appear.
- Smaller tree species including *Acacia decurrens* (Black Wattle) and *Acacia binervia* (Coast Myall) were also regenerating with second generation individuals present.
- A midstorey that varied from dense stands of *Kunzea ambigua* (Tick Bush) or the non-local species *Leptospermum laevigatum* (Coast Teatree) to scattered *Acacia* species interspersed with other less abundant native species.
- Highly effective weed control actions reduced weed cover where extensive stands of the weed *Andropogon virginicus* (Whiskey Grass) and smaller populations of *Eragrostis curvula* (African Lovegrass) were present and excluded all other species. Weed cover was generally low with weed control providing good on-going results.
- Increasing colonisation by native grasses with cover increasing annually in most areas, including where exotic grasses have been controlled.
- Vegetation was dominated by *Acacia* species, many of which are senescent or in some sections mixed native vegetation that is not representative of the local native plant communities. Senescent Acacias becoming less common.
- Good species diversity including target species of nearby remnant vegetation; however, many species had a low abundance.
- All species exhibited signs of good reproduction potential including the threatened species, *Persoonia bargoensis* and *Grevillea parviflora* subsp. *parviflora* (Small-flower Grevillea).

Characteristics of sections revegetated in 2007 (Stage 8):

- originally planted with pasture species as a stabiliser, and was still dominated by exotic grasses in 2016
- trial of reseeded using the soil amelioration product OGM proved not suitable for the REA
- very limited cover by native species, both target and non-target
- scattered patches of native grasses with good cover prior to 2017
- revegetation and rehabilitation measures were ceased in 2023

Characteristics of sections revegetated post 2010 are:

- generally good germination rates on level areas with species from all strata represented

- germination more variable on slopes but still adequate
- growth rates moderate to very good
- limited weed populations.

## 2.2 Monitoring results in 2023

### EROSION CONTROLS

Erosion control structures, which were implemented in 2019, remain in good condition and no major erosion was recorded along the slopes of the REA. An area in Stage 1, where seepage affected vegetation growth, was rehabilitated with the ripping of the soil surface and mulching in 2018 (Figure 1). This area continues to be in a good condition with no seepage evident in 2023. Nearby the seepage area, minor erosion has been recorded, this should continue to be monitored and minor works required to rectify the erosion if required. Over the past 12 months average rainfall has been slightly below average. All erosion control measures, and gully erosion should still be monitored to prevent significant erosion developing.

### GRASS TRIALS

Monitoring of grass trials was undertaken as part of the 2023 works. The fencing around most of the grass trials has been damaged by Kangaroos. A quantitative analysis of grass trials had showed average regeneration rates of eucalypt species and *Allocasuarina littoralis* species. Other shrub and grass species were also prevalent despite some evidence of minor grazing activity. Previously, this was evident within Stages 1, 2 and 3, however grass growth rates were also observed within Stages 4 and Stages 14 and 16.

The reference plots and permanent monitoring plots which were burnt by fire in 2019 have recovered well and have a diversity and abundance of species similar to those species within the REA. There is continued evidence of nutrient recycling with termite mounds, ants and scats noted in those burnt plots. Litter cover has stabilised in these plots with grass, leaf litter and twigs recorded in all plots. Plot data is available in Appendix A.

### REFERENCE AND PERMANENT PLOT MONITORING

Most reference and permanent monitoring plots recorded a slight decrease in native understorey species cover and diversity, though regeneration of midstorey and canopy species remains stable with emergent juveniles including *Acacia* spp., *A. littoralis*, *Eucalyptus globoidea* and *E. punctata*. Similar changes to vegetation structure and composition were observed in the reference plots and may be a result of slightly below average rainfall and higher than average temperatures experienced throughout the year.

Overall, weed cover significantly decreased across all monitoring plots when compared with 2022 results. This may be attributed to the warmer, dryer weather conditions in addition to weed management practices.

Additional characteristics and changes that were noted within the required monitoring plots include:

- adequate growth of the diameter at breast height (DBH) in all canopy species including juveniles and seedlings
- continued senescence of *Acacia* spp.

- treatment of *Acacia saligna* across Stages 1 to 5 has controlled the spread of this species.
- gully erosion becoming more apparent at the outermost eastern edge of Stages 12a and Stage 14.

Table 1 provides further details of the monitoring results from 2023 in comparison with results from earlier years and recommendations.

Figure 1: Stage boundaries, reference plots and permanent monitoring plots within the REA.

Table 1: Key monitoring results

Key Characteristics	Summary - Results from Permanent Plot surveys 2010 – 2017 and Walkover surveys 2018 - 2022	Results from survey 2023	Recommendations
<b>Soil profile development</b>	<p>Highly variable and developing in the older stages of rehabilitation around leaf and grass litter, fallen timber, native grass clumps, and newer revegetation in rip lines.</p> <p><u>2020</u></p> <p>Development recorded in rip lines and areas with high leaf litter. Low grass cover litter due to drought conditions.</p> <p><u>2022</u></p> <p>Soil profile continues to develop across all areas of the REA and litter cover has generally improved or remained consistent across all monitoring plots.</p>	<p>Soil profile continues to develop across all areas of the REA and litter cover has generally improved or remained consistent across all monitoring plots in 2023.</p>	<p>Continue to monitor soil profile</p>
<b>Evidence of erosion</b>	<p>Isolated areas of minor gully erosion, rill and sheet wash have been recorded. Remediation works carried out at several locations.</p> <p>Additional drains installed to direct stormwater and addressing erosion in new rehabilitation area. Stormwater drains in some sections were rock lined to provide better erosion control.</p> <p><u>2020</u></p> <p>Limited, minor gully erosion present across the REA.</p> <p><u>2022</u></p> <p>Limited, some erosion noted past the seepage area to the north of Stage 1 which should be monitored.</p>	<p>Evidence of erosion is present within the lower stages of 12a and 14 between the edge of the REA and the existing fence line to the east.</p>	<p>Consider if further action is required for more significant areas of gully erosion with native fill.</p> <p>Continue to monitor for minor gully erosion and repair with minor works such as infilling with logs and branches</p>
<b>Native plant species diversity</b>	<p>Species diversity has increased since monitoring began, with an increase in groundcover species seen in areas of weed control within the early revegetation areas.</p>	<p>Native species diversity of canopy, shrubs and grasses is generally consistent across the REA and many of the</p>	<p>Maintain weed control program with attention to avoiding off-target damage to native species.</p>

Key Characteristics	Summary - Results from Permanent Plot surveys 2010 – 2017 and Walkover surveys 2018 - 2022	Results from survey 2023	Recommendations
	<p>Native herbs and forbs are more abundant in areas where native grasses are colonising.</p> <p>The midstorey is dominated by <i>Acacia</i> spp., but also includes <i>Dodonaea</i> spp., <i>Persoonia</i> spp., <i>Kunzea ambigua</i> and <i>Cassinia</i> sp.</p> <p>Groundcover species diversity is good with herbs, sedges, lilies, and grasses all represented; however, many species have low abundance.</p> <p><u>2020</u></p> <p><u>Burnt vegetation</u></p> <p>Reference sites and Stages 6 and 9 were consumed by fire in 2019. These areas show evidence of epicormic growth in canopy species.</p> <p>Midstorey species consumed by fire and have not begun to regenerate yet.</p> <p>Grass and forb cover in the understory is regenerating and generally includes good species diversity and cover and include target species.</p> <p>Leaf and twig litter is slowly accumulating.</p> <p><u>Non-burnt vegetation</u></p> <p>Native species diversity remains consistent overall allowing for a dry season and a decrease in species diversity in undisturbed bushland. <i>Acacia</i> diversity reduced with senescence in some shrub species.</p> <p>Senescence of <i>Hakea</i> species also noted across stages 1 and 2.</p> <p>The number of target species (i.e., those consistent with reference sites and nearby native vegetation) within</p>	<p>target species within the adjacent bushland have also colonised within the REA.</p>	

Key Characteristics	Summary - Results from Permanent Plot surveys 2010 – 2017 and Walkover surveys 2018 - 2022	Results from survey 2023	Recommendations
	<p>each monitoring plot remains adequate to good despite earlier drought conditions.</p> <p>Species diversity in canopy species adequate on average in most REA stages, however some sections have more limited diversity. Midstorey species diversity more limited. Forb species diversity is limited.</p> <p><u>2022</u></p> <p>Regeneration of <i>Acacia</i> spp. is high and many seedlings and saplings of <i>Eucalyptus</i> spp. and <i>Allocasuarina littoralis</i> noted within and around plots.</p> <p>Grass and forb cover in the understorey is regenerating and generally includes good species diversity and cover and includes target species.</p> <p>Leaf and twig litter has significantly increased.</p> <p><u>Non-burnt vegetation</u></p> <p>Most plots recorded increased percentage of understorey cover including shrubs and non-grasses.</p> <p>Native grass cover tended to decline overall</p> <p>Good diversity of species noted across the REA.</p> <p>Expected that target species in non-burnt plots will better align with the Reference sites as they continue to regenerate</p>		
<p><b>Native plant cover (overstorey, midstorey, groundcover)</b></p>	<p>Native cover is highly variable within all strata across the REA and, with some small areas devoid of vegetation.</p> <p>Canopy cover varies from good to very low, with much of the revegetation too young to provide a meaningful measurement.</p>	<p>Native vegetation cover is stable within Stages 1 to 5 within the REA. Native cover has increased within Stage 12a and the lower sections of Stage 14 and 16. Whilst there is cover of scramblers and shrubs continuing to develop within the upper stages of 14 and 16, the overall cover of native grasses is generally low.</p>	<p>Consider undertaking more native grass trials within the upper stages of 14 and 16.</p>

Key Characteristics	Summary - Results from Permanent Plot surveys 2010 – 2017 and Walkover surveys 2018 - 2022	Results from survey 2023	Recommendations
	<p>Sub-shrub cover is more limited with a number of species failing to reach maturity.</p> <p>Groundcover varies within the established revegetation areas from 100% to 0%. Colonisation by grasses and groundcover species is patchy but improving slowly.</p> <p><u>2020</u></p> <p>Native plant cover remains variable across the REA, with groundcover varying greatly and some areas devoid of groundcover species.</p> <p>Otherwise, native plant cover is increasing at a slow rate.</p> <p>Colonisation by groundcover species including grasses and sedges delayed by earlier drought conditions</p> <p>In more recent revegetation areas, native cover is consistent with high numbers of juvenile canopy species.</p> <p><u>2021</u></p> <p>Native plant cover has generally increased across the REA with most plots recording increase in cover of understorey stratum. Areas which have the least groundcover are within I1 and I2. Continue to monitor native plant cover in these plots and consider infilling with native grass tubestock.</p> <p><u>2022</u></p> <p>Notable recruitment in midstorey stratum, as permanent plots continue to progress. Overstorey species second generation recruitment evident and consistent across the REA.</p>		

Key Characteristics	Summary - Results from Permanent Plot surveys 2010 – 2017 and Walkover surveys 2018 - 2022	Results from survey 2023	Recommendations
	<p>Previously noted that plots I1 and I2 (Stage 12b) lacked groundcover species; result from 2022 monitoring recorded increase in understorey live cover and increase in total number of native species.</p>		
<p><b>Native plant growth rates and regeneration</b></p>	<p>Canopy species growth is adequate and is consistent with the growth rates determined in the undisturbed nearby native vegetation. Second generation canopy species are prevalent in the earlier revegetation areas.</p> <p>Many <i>Acacia parramattensis</i> are senescent or have died and fallen.</p> <p>Some species (particularly sub shrubs) failing to thrive to maturity, possibly due to selective herbivory by rabbits.</p> <p>Native grasses are regenerating and spreading in some sections strongly.</p> <p><u>2020</u></p> <p>For those monitoring plots burnt in the 2019 bushfires the following characteristics were noted:</p> <ul style="list-style-type: none"> <li>• all strata consumed by fire</li> <li>• canopy species showing epicormic growth</li> <li>• midstorey is absent, <i>Allocasuarina</i> and <i>Acacia</i> species did not survive hot fire</li> <li>• groundcover has recolonised following fire, generally low cover however, some monitoring plots have higher diversity of species post fire.</li> <li>• leaf litter and woody material largely consumed by fire, reduced cover of grass, twig litter is available.</li> </ul>	<p>The growth rate in canopy species remains consistent and small increases recorded in all plots across the REA in 2023.</p>	<p>Nil.</p>

Key Characteristics	Summary - Results from Permanent Plot surveys 2010 – 2017 and Walkover surveys 2018 - 2022	Results from survey 2023	Recommendations
	<p>Growth rates are variable in newly established revegetation areas. Growth rates are generally better in those areas with low slope, indicating that moisture availability is limiting growth on steeper sections.</p> <p>The growth rate in canopy species remains consistent. Senescent <i>Acacia</i> midstorey species are present across the REA. Growth rates, other than that of sub-shrubs, are adequate but variable. Second generation recruitment in this stratum is greatest in <i>Acacia</i> species, with recruitment in other species increasing slowly.</p> <p>Native grasses have increased in some monitoring plots despite drought conditions.</p> <p><u>2021</u></p> <p>The growth rate in canopy species remains consistent and small increases recorded in all plots across the REA.</p> <p><u>2022</u></p> <p>The growth rate in canopy species remains consistent and small increases recorded in all plots across the REA.</p>		
<p><b>Threatened flora</b></p>	<p>Two threatened species have been observed within the rehabilitation areas,</p> <p><i>Grevillea parviflora</i> subsp. <i>parviflora</i> and <i>Persoonia bargoensis</i></p> <p><u>2020</u></p> <p>The population of <i>Grevillea parviflora</i> subsp. <i>parviflora</i> within Stage 6 has significantly decreased as a result of fire in late 2019. One individual seedling was found within this area during 2020 monitoring.</p>	<p>Stable populations of <i>Grevillea parviflora</i> subsp. <i>parviflora</i> and <i>Persoonia bargoensis</i> in Stages 6 and 9.</p> <p>Stable populations of <i>Persoonia bargoensis</i> where it has not been recorded previously across Stage 3 and 4.</p>	<p>Continue to monitor threatened species populations.</p> <p>Weed control in the vicinity of these species to be carried out by hand.</p>

Key Characteristics	Summary - Results from Permanent Plot surveys 2010 – 2017 and Walkover surveys 2018 - 2022	Results from survey 2023	Recommendations
	<p>The population of <i>Persoonia bargoensis</i> is increasing within areas of early revegetation. It is unknown if the plants previous recorded within the No 2 shaft 11kV power line were lost to fire in late 2019.</p> <p><u>2021</u></p> <p>Stable populations of <i>Grevillea parviflora</i> subsp. <i>parviflora</i> and <i>Persoonia bargoensis</i>.</p> <p><u>2022</u></p> <p>Stable populations of <i>Grevillea parviflora</i> subsp. <i>parviflora</i> and <i>Persoonia bargoensis</i> in Stages 6 and 9.</p> <p><i>Persoonia bargoensis</i> also recorded in some permanent monitoring plots in Stages 3, 4, &amp; 5 and Stage 10 where it has not been recorded previously.</p>		
<b>Weed occurrences and cover</b>	<p>Weed densities were highly variable across the REA. Heavy infestations of <i>Andropogon virginicus</i> (Whiskey Grass) and smaller populations of <i>Eragrostis curvula</i> (African Lovegrass), <i>Sisymbrium officinale</i> (Hedge Mustard) and <i>Nassella trichotoma</i> (Serrated Tussock) were observed within the early rehabilitated areas in the north of the REA prior to 2010. Weed control programs were instigated with strong results. <i>Andropogon virginicus</i> and <i>Eragrostis curvula</i> continued to be present in isolated patches within the REA.</p> <p><i>Cenchrus setaceus</i> (Fountain Grass) colonised the slopes of Stage 5 in 2017.</p> <p><u>2020</u></p> <p>Weed cover is generally low across the REA, however there is increased cover by <i>Eragrostis curvula</i> in several stages - the upper benches of Stages 14 and 16 and</p>	<p><i>Gomphocarpus fruticosus</i> not recorded across REA.</p> <p><i>Cenchrus setaceus</i> not recorded across REA.</p> <p>New exotic population of <i>Cenchrus longisetus</i> (Fox-tail Grass) noted in isolated areas within the REA within Stage 2, Stage 3 and Stage 5.</p>	<p>Increase weed monitoring and weed control program overall, targeting key areas of new weed infestations.</p> <p>Take care to avoid off-target species during weed control works.</p> <p><i>Cenchrus longisetus</i> (Fox-tail Grass) control – herbicide options to treat Fox-tail Grass include:</p> <p>Flupropanate 745 g/L (Tussock®) Rate: 300 mL per 100 L of water Comments: Spot spray application. Herbicide group: 15 (previously group J),</p> <p>Glyphosate 360 g/L (Various products) Rate: 335ml in 100 L of water Comments: Spot spray application.</p>

Key Characteristics	Summary - Results from Permanent Plot surveys 2010 – 2017 and Walkover surveys 2018 - 2022	Results from survey 2023	Recommendations
	<p>Stage 12, and the western section of stage 10. Patches of this weed are increasing across the REA.</p> <p><i>Cenchrus setaceus</i> (Fountain Grass) continues to spread on the slopes of Stage 5.</p> <p>The population of <i>Sisymbrium officinale</i> has increased over the last 12 months.</p> <p>The small population of <i>Gomphocarpus fruticosus</i> (Narrow-leaved Cotton Bush) has increased over the last 12 months.</p> <p><u>2021</u></p> <p>The population of <i>Gomphocarpus fruticosus</i> was significantly lower than previous year.</p> <p>Populations of <i>Sisymbrium officinale</i> and <i>Cenchrus setaceus</i> continue to spread across Stage 5 and parts of Stage 1.</p> <p>Large area of <i>Eragrostis curvula</i> present on top of upper benches of Stages 14 and 16 and Stage 12</p> <p><u>2022</u></p> <p><i>Gomphocarpus fruticosus</i> not recorded across REA</p> <p><i>Cenchrus setaceus</i> not recorded across REA</p> <p>Populations of <i>Sisymbrium officinale</i> and <i>Eragrostis curvula</i> continue to spread across Stage 5 and parts of Stage 1.</p> <p>Large area of <i>Eragrostis curvula</i> present on top of upper benches of Stages 14 and 16 and Stage 12</p>		<p>Apply when plant is actively growing. Withholding period: Nil. Herbicide group: 9 (previously group M).</p> <p>Continue to monitor for other weeds including <i>Gomphocarpus fruticosus</i> and continue to remove and bag seed heads as isolated occurrences are recorded during monitoring.</p>
<b>Non-local native species</b>	Non-local native species are common within those sections of the REA which were revegetated prior to 2000 and are uncommon elsewhere. <i>Leptospermum</i>	It was noted that significant control works have been undertaken within the REA for <i>Acacia saligna</i> . In	Continue to control the spread of <i>Leptospermum laevigatum</i> by

Key Characteristics	Summary - Results from Permanent Plot surveys 2010 – 2017 and Walkover surveys 2018 - 2022	Results from survey 2023	Recommendations
	<p><i>laevigatum</i> is the most abundant non-local native species and is colonising strongly outside the original area of planting. <i>Acacia saligna</i> (Western Australian golden wattle) was recorded as both mature trees and juveniles. This species was controlled across the REA prior to November 2016. Most other species within this category are present in limited numbers and populations are not increasing.</p> <p><u>2020</u></p> <p><i>Leptospermum laevigatum</i> remains abundant within the oldest revegetation area with scattered individuals beyond stages 1 and 2. These species have not been included in more recent seedlings for revegetation within the REA.</p> <p>Limited <i>Acacia saligna</i> seedlings were located across the REA.</p> <p><u>2021 -</u></p> <p><i>Leptospermum laevigatum</i> remains abundant. <i>Acacia saligna</i> is limited.</p> <p><u>2022</u></p> <p><i>Leptospermum laevigatum</i> remains abundant. <i>Acacia saligna</i> is limited.</p>	<p>particular many areas where this species was present within Stages 2 and 3 have been treated.</p>	<p>controlling seedlings outside stages 1 and 2.</p> <p>Maintain monitoring for <i>Acacia saligna</i> and control opportunistically during weed control activities.</p>
<p><b>Feral fauna</b></p>	<p>Evidence of significant rabbit population. Herbivory by this species was considered to be impacting on the success of revegetation by the selective removal of some species. Rabbit population controlled in 2017.</p> <p><u>2020</u></p> <p>A small rabbit population remains.</p>	<p>No rabbits noted during field survey, however it is likely that a population remains in the area.</p>	<p>Rabbit monitoring to continue and conduct a control programme in conjunction with neighbouring properties if required. Consultation by Tahmoor Coal with Local Land Services advisable.</p>

Key Characteristics	Summary - Results from Permanent Plot surveys 2010 – 2017 and Walkover surveys 2018 - 2022	Results from survey 2023	Recommendations
	<p><u>2021</u> A small rabbit population remains.</p> <p><u>2022</u> Rabbits noted during field surveys</p>
